ENTERED

7/96

Delitschia winteri

perithecia 500 μ m diam

white granular at neck

Spores clear brown

54.5 - 58.6 \times 25.5 - 26 - 29

body restricted to septum, septum \pm transverse.

Asci 3 μ m diam \times 400 - 500 μ m

Schizotheca tetraspora

Asciobolus

Asciobolus 2000 ~~1500~~ 2000 μ m diam. Not fulvous. albidus type.

Spores 19 - 19.5 \times 11 - 11.5 with "fingerted" lines
-21 - 22.5

probably albidus variant

— Same with Peck, lower spores.

given large size, possibly michardii?

Penthea yellowish 26 μ m diam. (few similar last?)
dark Spore in side

Sphaerodes fumicola 232 \times 3

Asci broad clavate. Spores dark, linear, 9 μ m at each end. 17.5 - 19 \times 9.5

neck ca 50 μ m diam \times 15 high = Melaospora
bispora

wall polygonal parenchymatous cells < 22 diam

Saccobolus

Spore mass 45 x 16 hyaline (holocarpic) X versicolor

22h

Glabrous perithecia? 275 µm diam black pointed hairs
< 10 µm radiata over upper leaf
immature

~~Very~~ stramine? Hypocapsa X

26-29 x 12.5-13 with good sheath 8 µm
-31

Asci 180 x 22-23

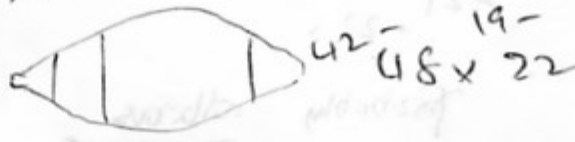

Plasmopora (21)

Spores st. asymmetrical flattened in view

Strophopora (30)

Pore blue ca 7-8 x 6.5 diam
germ slits 19 µm long.

~~Asci~~ -type spores

Monacrosporion

Noted extreme being stramine immature

Hairs up to 165 µm long Septate: 3 µm diam.

Chesterium Spored hairs 165 µm diam

clavate asci

Spores uniseriate

Xestrychodes

ca 60 µm x 10

Spores immature ca

8 µm x 1

25h

1 immature Coniochaeta

Podospora (brown)

Conochaete S-spored 11-11.5 x 7.5-8 x 5-6
Setae up to 45 μ Igniaria X

S Spored Schizothecium

26 - 19.3 x 9.5-14

?

vesticula / hyphalium

7/8

Hymenozoa under white mycelial mass - anything to do with it?

dark hairs on stroma under mycelium

oblong + pale at tips, septate, < 200 long x 2.5-3.

Spora -29 27-27.5 x 12.5-13 Partially bicarinate.

Very black in germ slit? - sl. granulate? to gel?

- good K+ Phog 6.5 x 8, remaining grey-blue

keys at to Planispora X

Asci 28.5 x 22.5

Other S7. imbricate specimens it's visible ca 19-23
