Abstract—A total of 205 lichen taxa (198 species, 2 subspecies, 4 varieties and 1 forma) and one lichenicolous fungus were identified from 25 different localities in Batman, Mardin, Osmaniye and Sivas regions of Turkey. *Cladonia metacorallifera*, *Caloplaca flavocitrina*, *C. variabilis* f. *ocellulata*, *Phaeophyscia chloantha* and *Usnea wasmuthii* are new to Turkey. 130 species and one lichenicolous fungus (*Lichenodiplis lecanorae*) are new records from Osmaniye. Moreover, 50 taxa are reported as new from Mardin, 35 from Sivas, and 23 from Batman. For every each taxon, the habitat pattern and distribution data are presented.

Keywords—*Ascomycetes*, flora, biota

Introduction

Compared to other countries, not many lichen studies have been conducted in Turkey previous to this decade, so that the lichen biota of Turkey remains poorly known. Recently, however, there has been a substantial increase in the number of lichenological papers for Turkey (Halıcı & Aksoy 2006, Yazıcı 2006, Yazıcı & Aslan 2006, 2007, Yazıcı & Aptroot 2007, Yazıcı et al. 2005). Although previous lichenological research (Breuss and John 2004, John 2002, John & Türk 2006, John et al. 2000, Hafellner & John 2006, Nimis & John 1998, Steiner 1921) has been reported for Batman,

Osmaniye and Sivas, no lichen records have thus far been reported for Mardin (Midyat). Additionally, several regions in Batman, Osmaniye, and Sivas remain still unexplored. This present paper provides information on the lichen biota in the above regions of Turkey.

Material and methods

The lichen samples were collected in 25 different localities from 15 August 2006 to 09 February 2007 (Table 1). The study area consists of four regions of Turkey: Batman, Mardin, Osmaniye and Sivas (Figure 1.) Air dried lichen samples were observed and studied using a stereo and a light microscope. Secondary metabolites were identified by usual spot tests (Clauzade and Roux 1985, Clerc 1997, Giralt 2001, Halonen et al. 1988, Mayrhofer 1988, Poelt 1974, Poelt & Vézda 1981, Purvis et al. 1992, Wirth 1995). The herbarium specimens studied were deposited in the herbarium of the Biology Department, Faculty of Sciences and Arts, Karadeniz Technical University, Turkey.

Sivas and Batman have a continental climates in which the summer seasons are hot and dry while winters are cold and snowy. Steppe vegetation is dominant in plateaux and hills. Temperatures range from a winter low of -34.6°C to a summer high of $+38.3^{\circ}\text{C}$. The mean annual humidity is 80.0% while the lowest is 55.2%. Mean annual rainfall is 420 mm (Akman 1990).

Osmaniye has a typical Mediterranean climate. Forests and shrub fields are quite large (42%). Lowlands are seen culture plants, macchia between 500–600 m and coniferous trees in upper fields. Osmaniye is bordered by the Toros mountains in the north and north-west, and the Amanos mountains in the east and south-east (Baytop et al. 1963).

Mardin (Midyat) is influenced by both mediterranean and continental climates. Mardin has rolling fields and mountains are not very high. *Quercus* communities grow in high fields of the mountains (Baytop et al. 1963). The highest precipitation is 115.8 mm in March. The lowest temperature is -2.6°C in February while the highest 42.5°C in July (Akman 1990).

Batman forests are composed of *Quercus*, *Juglans*, *Populus*, *Platanus*, *Pistacia*, *Pyrus* and *Prunus* (Baytop et al. 1963). The summer mean temperature is 28°C , and the winter mean is 3.9°C in winters. Mean annual precipitation is 713.4 mm (Akman 1990).

Results

The taxonomic survey of Batman, Mardin, Osmaniye and Sivas yielded 205 lichen taxa (198 species, 2 subspecies, 4 varieties, 1 forma) representing 70 genera in 31 families in the *Ascomycota*. Additionally, one lichenicolous fungus was identified. Of these, 146 taxa were collected in Osmaniye, 50 in Mardin, 39 in Sivas, and 24 in Batman. New records per province include 130 lichens and the lichenicolous fungus (*Lichenodiplis lecanorae*) for Osmaniye, 50 lichens for Mardin, 35 lichens for Sivas, and 23 lichens for Batman. The lichen taxa are listed alphabetically. Asterisks indicate new records for Turkey while "BA" designates Batman, "MA" Mardin, "OS" Osmaniye and "SI" Sivas.

- Verrucaria dufourii* DC., Locality 25, on hard limestone[BA].
- Verrucaria fuscella* (Turner) Winch, Locality 24, on calcareous rock[MA].
- Verrucaria lecideoides* (A. Massal.) Trevis., Locality 24, on calcareous rock[MA].
- Verrucaria macrostoma* Dufour ex DC., Locality 24, on calcareous rock[MA].
- Verucaria muralis* Ach., Locality 10, 24, on calcareous rock[MA, OS].
- Verrucaria nigrescens* Pers., Locality 23, 24, 25, on calcareous rock[BA, MA].

Discussion

Caloplaca flavocitrina, *C. variabilis* f. *ocellulata*, *Cladonia metacorallifera*, *Phaeophyscia chloantha* and *Usnea wasmuthii* are new to Turkey.

Of the 205 taxa, 111 are crustose, 56 foliose, 26 fruticose, and 2 leprose. Further, 86 taxa were epiphytic, 88 saxicolous, eight terricolous, 4 epiphytic or saxicolous, 5 epiphytic or terricolous, and 3 terricolous or saxicolous. Substrates were varied, with 5 taxa growing on decayed barks, 9 on mosses, 10 on limestone, 21 on coniferous trees, and 29 on deciduous trees. In the study area all of the species were found on 20 different substrata.

Caloplaca, *Cladonia*, *Lecanora*, *Rinodina*, *Verrucaria* and *Physcia* are the common genera in the area researched. Among the common genera, *Caloplaca* is the most diverse (represented by 17 species), with 17 taxa occurring in Mardin and 9 in Sivas. The members of the genus *Cladonia*

were only found in Osmaniye. Foliose genera such as *Xanthoria*, *Phaeophyscia*, *Physcia*, *Melanelia*, *Parmelia*, *Melanelixia*, *Melanohalea*, were mostly found in Osmaniye and Sivas regions on mostly deciduous trees i.e. The members of *Lecanora* and *Physcia* were only found in Osmaniye. Four *Lecanora* species were growing on rocks while four *Physcia* species on deciduous trees *Carpinus*, *Prunus*, *Pyrus*, *Quercus*, and *Salix*. Saxicolous crustose lichens were found in all the stations and are very common, especially in Osmaniye (Büyük Kuyucak district), Osmaniye (Center); Zorkun high plateau (Sarıüce District), Sivas (İşhanı village), Sivas (Center); Mardin (Midyat); Açırlı village and Batman (Arica village).

Localities 1, 7, 10, 24 and 25 are situated near a lime pit *Aspicilia calcarea*, *Verrucaria dufourii*, *V. calciseda* and *V. muralis*, which are determined as indicator species of lime and calcareous substratum, was found only in Osmaniye: Sarıüce, Yoncalı, Mardin: Midyat, Açırlı village and Batman: Arica, which are situated near a lime pit. On the other hand, saxicolous species *Verrucaria compacta*, *V. fuscella*, *V. lecideoides*, *V. marmorea* and *V. nigrescens* were also recorded in station 24 and 25.

Crustose species were seen nearly in all stations and are very common mostly on rocks and limestones in stations 5, 7, 15, 16, 24, 25. Because rocks are abundantly in Mardin and Batman crustose species such as *Rinodina*, *Caloplaca*, *Lecania*, *Lecanora*, *Lecidea*, *Lecidella* were found to be growing mostly on rocks in these stations.

Foliose genera such as *Xanthoria*, *Phaeophyscia*, *Physcia*, *Melanelia*, *Parmelia*, *Melanelixia*, and *Melanohalea*, were mostly found in Osmaniye and Sivas provinces on deciduous trees such *Carpinus* sp., *Prunus* sp., *Pyrus* sp., *Quercus* sp. and *Salix* sp. *Peltigera* and *Pertusaria*, found only in Osmaniye, were not found abundantly and the same is true with fruticose species such as *Alectoria*, *Ramalina*.

Several sensitive species, according to Purvis et al. (1992) and Wirth (1995), such as *Lobaria pulmonaria*, *Pertusaria amara*, *Pertusaria coccodes*, *Pertusaria pertusa*, *Physcia aipolia*, *Ramalina calicaris*, *Ramalina farinacea*, *Ramalina fraxinea* and *Usnea* spp. were found in the study area, especially in Osmaniye.

Aspicilia desertorum, *Caloplaca haematites*, *Caloplaca persica*, *Fuscopannaria* cf. *praetermissa*, *Lecanora strobilina*, *Lecidea lithophila*, *Rinodina guzzini*, *Rinodina luridescens*, *Staurothele caesia*, *Usnea cavernosa*, *Verrucaria dufourii*, *Verrucaria fuscella* and *Verrucaria lecideoides* have rarely been recorded in Turkey so far.

Acknowledgements

We are grateful to Dr. Orvo Vitikainen, Dr. Paul Diederich, and Dr. Ludmilla F. Untari for linguistic revision and helpful comments on an earlier draft of this paper. We also thank Maşuka Dağdelen, Hülya Tan and Ayşe Aracı for help in collecting samples.
